

## Thermocouple (T/C) Construction of thermocouple

The effect responsible for the action of thermocouple is the " Seebeck effect ". If a temperature difference exists along a wire , this will causes a displacement of electrical charge . The amount of the charge displacement depends on the electrical characteristics of the chosen material.

If two wires of different materials are joined at one point and then subjected to a temperature , then a voltage difference will be generated between the open ends of the two wires . In order to be able to measure the temperature at the junction, the temperature at the open end must be known. If the temperature of the open end is not known, then it must be extended (by a compensating cable) into the zone of known temperature (reference junction, usually referred to as the "cold junction").

The temperature of the reference junction must be known and constant. the exact temperature is equal joined junction temperature plus cold junction temperature .

**TYPE OF MEASURING JUNCTION**

TYPE	SHAPE	FEATURE
Grounded		<ul style="list-style-type: none"> <li>1. This type can withstand 3500kg/cm<sup>2</sup> or more</li> <li>2. It is not suitable for location with electromagnetic induction or radio frequency interference</li> </ul>
Ungrounded		<ul style="list-style-type: none"> <li>1. This type has a slower response than the grounded type but is more commonly used since it is not restricted by the object to be measured</li> <li>2. The element is covered with an insulator thereby ensuring a long life span .</li> </ul>
Exposed		<ul style="list-style-type: none"> <li>1. Since the element is exposed response time is very fast</li> <li>2. This type is suitable for temperature measurement of gases such as automotive exhaust .</li> <li>3. This type is mechanically weaker than the other.</li> </ul>

### MINERAL INSULATED THERMOCOUPLE

1. wide application in measuring small diameter is very useful for the place where space is at premium .
2. quick response
3. easily bent for installation
4. long life span
5. excellent mechanical strength and pressure resistance

## FEATURE OF THERMOCOUPLE

Type	feature
B	Thermocouple which combines a positive wire of a platinum-rhodium alloy containing 70% platinum and 30% rhodium with a negative wire of platinum rhodium containing 94% platinum and 6% rhodium. Type B is more resistant to heat and mechanical stress than type R, and withstands 1800°C Max. Other features are the same as those of type R.
R&S	Thermocouple which combines a positive wire of a platinum and rhodium alloy containing 87% platinum and 13% rhodium with a negative wire of pure platinum. This thermocouple is highly accurate, excellent in heat resistance and stability, generally used in oxidizing atmospheres. It is not recommended for use in reducing atmospheres or where metal vapors are present.
	Thermocouple which combines a positive wire of a platinum rhodium alloy containing 90% platinum and 10% rhodium with a negative wire of pure platinum. Other features are the same as those of type R.
N	This is called Nicrosil (positive leg) / Nisil (negative leg) Thermocouple, and its composition and characteristics are very similar to those of type K Thermocouple. It is an improved type of Type K Thermocouple and has more Si additive, higher heat resistance.
K	Thermocouple which combines a positive wire of an alloy consisting mainly of nickel and chromium with negative wire of an alloy consisting mainly of nickel. This thermocouple widely used for many particularly should not be used in carbon monoxide, sulfurous acid gas or sulfur bearing hydrogen atmospheres.
E	Thermocouple which combines a positive wire of thermocouple K with a negative wire of thermocouple J. This thermocouple has a high thermal emf and is suitable for use in oxidizing atmosphere.
J	Thermocouple which combines a positive wire of iron with thermocouple is resistant in reducing atmospheres and is also resistant to hydrogen and carbon. However it should not be used in atmospheres that will oxidize iron. It is relatively low in cost and often used for medium temperature range applications.
T	Thermocouple which combines a positive wire of copper with a negative wire of an alloy mainly of copper and nickel. High accuracy is obtained at under 300°C, and it is suitable for low temperatures from -200°C to +100°C. It is suitable for use in weak oxidizing and reducing atmospheres.

(1) Tolerance is referred to as the maximum allowable deviation between measuring junction temperature and the temperature derived from the emf table.

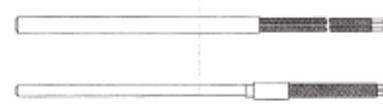

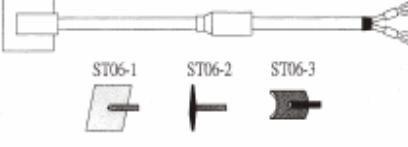

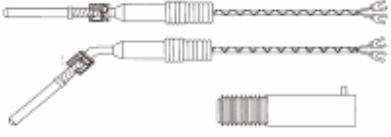

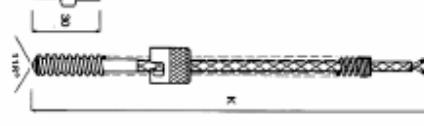

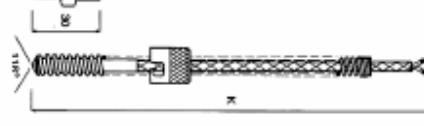

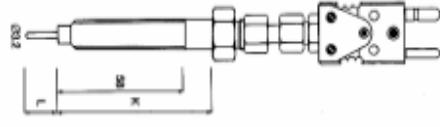

(2) ASTM tolerance is °C or % value for the measured temperature, whichever is greater

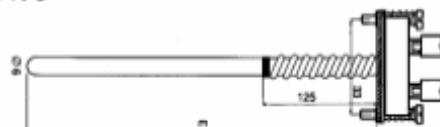

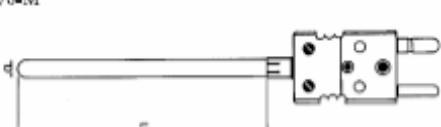

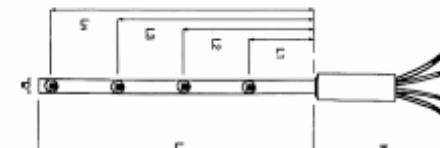

(3) It means measuring temperature indicated with the temperature (°C) having no connection with the positive or negative mark.

(4) Classes 1, 2, 3 correspond to former JIS Classes 0.4, 0.75, 1.5 respectively.

(5) JIS, BS, DIN standards are same as IEC standard.

(6) ASTM standard is former ANSI standard.
